Introduction to

What is tensorflow (tf)?

" TensorFlow™ is an open source software library for numerical computation using data flow graphs. Nodes in the graph represent mathematical operations, while the graph edges represent the multidimensional data arrays (tensors) communicated between them. The flexible architecture allows you to deploy computation to one or more CPUs or GPUs in a desktop, server, or mobile device with a single API. TensorFlow was originally developed by researchers and engineers working on the Google Brain Team within Google's Machine Intelligence research organization for the purposes of conducting machine learning and deep neural networks research, but the system is general enough to be applicable in a wide variety of other domains as well".

When should I care about tf?

- I need to speed up my math computations and I want to use GPU.
 - Use cuda if you are brave enough
- I am doing some optimization problem
 - Implement gradient computation and optimizers otherwise.
- I want to do big scale machine learning
 - For small scale use scikit-learn, R...

Why to choose tf?

- Multi-GPU support
- Cluster/cloud systems supported
- High performance, comparable to other popular frameworks (Torch, Theano)
- "Easy" to deploy for production
- Powerful visualization tool (tensorboard)
- Python and C++ API
- Supported by Google
- Tons of learning resources (Udacity course, playground, tutorials...)
- Easy installation (conda install, pip install...)

How does tf work?

- 1) You define desired operations (computation graph)
- 2) You create a session and use it to inject data and to grab results
- 3) Tf will compile your desired operations as soon as you execute your program
- 4) Tf will manage device communication and operations in a very efficient manner

tf program structure

```
1 import os
 2 import tensorflow as tf
 3 import numpy as np
 5 #Placeholder(interface variables) definition
 6 x= tf.placeholder(dtvpe=tf.float32, shape=[3, 3], name="x")
 7 y= tf.placeholder(dtype=tf.float32, shape=[3, 3], name="v")
 9 #Graph computations definition
10 myResult1= tf.add(x, y) #same as x + y
11 myResult2= tf.matmul(myResult1, tf.transpose(x))
12
13
14 #Create session and initialize variables
15 session = tf.Session()
16 session.run(tf.global variables initializer())
17
18 #actual data
19 x_input= np.array([[1,2,3],[1,2,3],[1,2,3]])
20 y_input= np.array([[1,1,1],[2,2,2],[3,3,3]])
21
22
23 #Do actual computations
24 feed dict= {x: x input, y:y input}
25 res1, res2= session.run([myResult1, myResult2], feed dict=feed dict
26 print(res1)
27 print(res2)
28 session.close()
29
```

Computation graph definition

```
1 import os
 2 import tensorflow as tf
 3 import numby as no
                                                                               myResult2
 5 #Placeholder(interface variables) definition
 6 x= tf.placeholder(dtype=tf.float32, shape=[3, 3], name="x")
 7 y= tf.placeholder(dtype=tf.float32, shape=[3, 3], name="v")
 9 #Graph computations definition
10 myResult1= tf.add( x, y) #same as x + y
11 myResult2= tf.matmul(myResult1, tf.transpose(x))
12
                                                                                          MatMul
                                                                                                             init
14 #Create session and initialize variables
15 session = tf.Session()
16 session.run(tf.global variables initializer())
18 #actual data
                                                                                               transpose
19 x_input= np.array([[1,2,3],[1,2,3],[1,2,3]])
20 y_input= np.array([[1,1,1],[2,2,2],[3,3,3]])
21
                                                      myResult1
22
23 #Do actual computations
24 feed dict= {x: x input, y:y input}
25 res1, res2= session.run([myResult1, myResult2], feed dict=feed dic
26 print(res1)
27 print(res2)
28 session.close()
29
```

Data will be injected here

Computation graph definition (2)

- Placeholders (for data injection)
 tf.placeholder(...)
- Constants

```
tf.constant(...), tf.zeros(...), tf.ones(...) ...
```

- Variables (model parameters, several initialization schemes)
 tf.get_variable(...)
- Operations (can be applied to Variables, Constants and Placeholders)

```
tf.add(...), tf.matmul(...), tf.exp(...), tf.diag_part(...) ...
```

Session creation and variable initialization

By default, tf.Session() will make use of all available resources.

- If several GPUs, all be allocated (although not necessarily used)
 - Select GPU using environmental variable CUDA_VISIBLE_DEVICE
- If no GPU all CPUs will be used (use tf.ConfigProto as argument to tf.Session() to set desired number)

Variables must be either initialized or loaded from checkpoints before being used

```
9 #Graph computations definition
10 myResult1= tf.add(x, y) #same as x + y
11 myResult2= tf.matmul(myResult1, tf.transpose(x))
12
14 #Create session and initialize variables
15 session = tf.Session()
16 session.run(tf.global_variables_initializer())
18 #actual data
19 x_input= np.array([[1,2,3],[1,2,3],[1,2,3]])
20 y_input= np.array([[1,1,1],[2,2,2],[3,3,3]])
21
22
23 #Do actual computations
24 feed dict= {x: x input, y:y input}
25 res1, res2= session.run([myResult1, myResult2], feed dict=feed dict
26 print(res1)
27 print(res2)
28 session.close()
29
```

Actual computation

```
variables

    MyResults1 and myResults2

14 #Create session and initialize variables
15 session = tf.Session()
16 session.run(tf.global variables initializer())
18 #actual data
19 x_input= np.array([[1,2,3],[1,2,3],[1,2,3]])
20 y_input= np.array([[1,1,1],[2,2,2],[3,3,3]])
23 #Do actual computations
24 feed dict= {x: x input. v:v input
25 res1, res2= session.run([myResult1, myResult2
                                                          feed_dict=feed_dict
26 print(res1)
27 print(res2)
28 session.close()
```

WARNING: session.run is not recommended for real Deep Learning situations. See tf.data for recommended data pipelines.

state will be save as numpy

Tf will do just needed

narrays res1 and res2

Graph variables we want to obtain.

computations to reach these

Dictionary

- Keys: graph placeholders
- Values: np.array's to inject into placeholders

One more interesting example

FFT usage example (numpy vs tf).

./1_tf_intro/examples/e2_fftExample.py

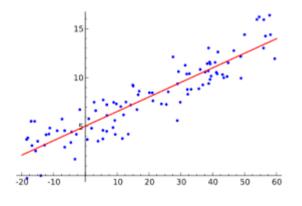

Matplotlib needed for results visualization: conda install matplotlib

```
5 #TF version
7 def tf ffshift2(x):
B n= x.get shape().as list()[1] #Number of shifts
9 p2= (n+1)//2
fftOutShiftedDim1= tf.concat([x[:,p2:n,:], x[:,0:p2,:]], 1)
1 fftOutShiftedFinal= tf.concat([fftOutShiftedDim1[:.:, p2:n], fftOutShiftedDim1[:.:, 0:p2]], 2)
 return fftOutShiftedFinal
4 def tf iffshift2(x):
5 n= x.get shape().as list()[1]
6 p2= n - (n+1)//2
7 ifftOutShiftedDim1= tf.concat([x[:,p2:n,:], x[:,0:p2,:]], 1)
B ifftOutShiftedFinal= tf.concat([ifftOutShiftedDim1[:,:, p2:n], ifftOutShiftedDim1[:,:, 0:p2]], 2)
9 return ifftOutShiftedFinal
1 def tfLPFilter(imgs):
2 #Placeholder(interface variables) definition
3 x= tf.placeholder(dtype=tf.complex64, shape=[None, imgs.shape[1], imgs.shape[2]], name="x")
4 x Real, x Imag = tf.real(x), tf.imag(x)
5 xMod= tf.sqrt(tf.square(x Real)+tf.square(x Imag))
6 #Graph computations definition
7 i x= tf iffshift2(x)
8 fftOut= tf.fft2d(i x)
9 fftOutOReal, fftOutOImag = tf.real(fftOut), tf.imag(fftOut)
fft0Mod= tf.sqrt(tf.square(fft0ut0Real)+tf.square(fft0ut0Imaq))
```

$$y_{pred} = b + x_1 w_1 + x_2 w_2 + ... + x_n w_n = (1, x_1, x_2, ..., x_n)(b, w_1, w_2, ..., w_n)^T$$

Or alternatively

$$y_{pred} = XW + b$$

Data preparation: $f(x,y,z) = x+y+z + uniform_noise$

```

Testing set should be used just once, when reporting performance. No decision must be taken using testing set performance

Your turn: implement Neural Network for regression

 $y_{pred} = W_2 g(XW_1) \rightarrow g \ can be \ sigmoid$, tanh, relu...

- If doubts API: https://www.tensorflow.org/api_docs/python/
- Try different number of layers, different number of neurons, different learning rate... See if your model is capable to overfit.
- If synthetic data is too easy, try to use realistic data
 - Add these 2 lines:
 - from keras.datasets import boston_housing
 - (x_train, y_train), (x_test, y_test) = boston_housing.load_data()
 - Data scaling can be an issue

My solution: ./1_tf_intro/exercises_sol/sol1_nNetReg.py

Your turn: logistic model for classification

- New error function: cross entropy
- cross-entropy = $-\frac{1}{N} \sum_{i=1}^{N} \sum_{j=1}^{k} t_{i,j} \log(p_{i,j})$
- New data set: cifar10 → 50K images of 10 categories: dog, cat, car, boat, ...
 - from keras.datasets import cifar10
 - (x_train, y_train), (x_test, y_test) = cifar10.load_data()
- Labels must be one-hot-encoded: do it automatically with:
 - sklearn.preprocessing.OneHotEncoder
- Data scaling can be an issue

```
21 #One-hot-encode labels
22 oh_encoder= OneHotEncoder(n_values=10, sparse=False)
23 y_train= oh_encoder.fit_transform(y_train)
24 y_test= oh_encoder.transform(y_test)
```

Scores (Logits)

Probabilities

My solution: ./1_tf_intro/exercises_sol/sol2_logRegr.py

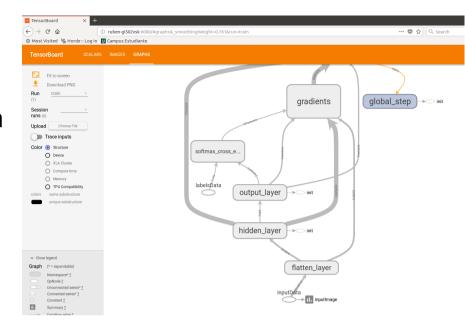

Your turn: implement Neural Network for classification

 $y_{pred} = softmax(W_2g(XW_1)) \rightarrow g \ can be \ sigmoid$, tanh, relu...

- You can use logistic regression script as starting point
- Try other architectures
 - Explore convolutional layers in API if you have finished
- Help yourself using tensorboard

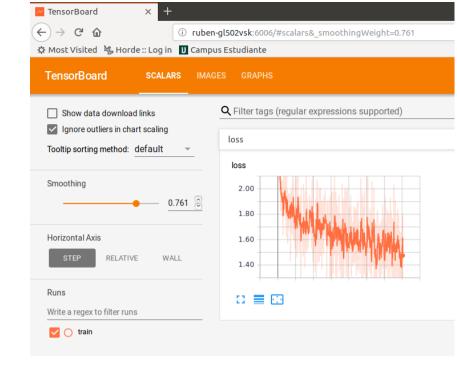

tensorboard

- Choose what you want to monitor in your graph
 - Scalar tensor:
 - tf.summary.scalar(name, scalar_tensor)
 - Images:
 - tf.summary.image(name, image_tensor)
 - Histograms:
 - tf.summary.histogram(name, any_tensor)
- Right after variables initialization
 - merged_summary= tf.summary.merge_all()
 - train_writer = tf.summary.FileWriter(dir/for/logs/train, session.graph)
 - validation_writer = tf.summary.FileWriter(dir/for/logs/test, session.graph)
- When training, ask for merged_summary and save it:
 - ___, m_summary= session.run([train_step, merged_summary], feed_dict=feed_dict)
 - train_writer.add_summary(m_summary, nStep)
- Do the same when computing validation
- Launch tensorboard from command line: tensorboard --logdir dir/for/logs/test
- Visualize it using your web browser and the url reported by tensorboard

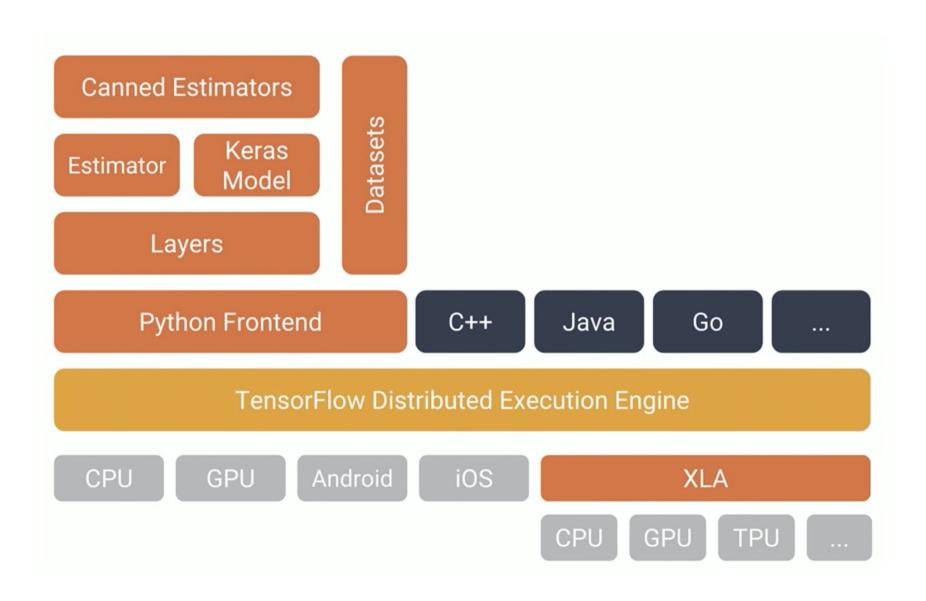

tensorboard

- Choose what you want to monitor in your graph
 - Scalar tensor:

- Visualize it using your web browser and the url reported by tensorboard

High level tf

Layers level tf

- No need to define weights and bias variables
- No need to care about tensor shapes except for the placeholders

```
33 inputPh= tf.placeholder(dtype=tf.float32, shape=[None] + list(x_train.shape[1:]) , name="inputData")
34 labelsPh= tf.placeholder(dtype=tf.float32, shape=[None, y_train.shape[-1]], name="labelsData",)
35 tf.summary.image('inputImage', inputPh)
36
37 conv2d_out= tf.layers.Conv2D(filters=32, kernel_size=5, strides=1, padding="same", activation=tf.nn.relu) (inputPh)
38 conv2d_out= tf.layers.MaxPooling2D(pool_size=4, strides=2) (conv2d_out)
39
40 input_flatten= tf.layers.Flatten() (conv2d_out)
41
42 h1_out= tf.layers.Dense(units=N_HIDDEN, activation=tf.nn.relu ) (input_flatten)
43
44 with tf.variable_scope("output_layer"):
45 logits= tf.layers.Dense(units= y_train.shape[-1], activation=None ) (h1_out)
46 y_pred= tf.nn.softmax(logits)
```

• Training, evaluation, checkpointing, etc. it is still cumbersome

My solution: ./1_tf_intro/examples/e4_nNet_tfLayers.py

keras

- Easy model definition
- Easy model training, evaluation, checkpointing

```
19 #Rescale data.
20 x train= x train /255.0
21 x test= x test /255.0
23 print(x_train.shape, y_train.shape, x_train.max(), x_train.min() )
24 #One-hot-encode labels
25 oh encoder= OneHotEncoder(n values=10, sparse=False)
26 y train= oh encoder.fit transform(y train)
27 y test= oh encoder.transform(y test)
28 print(x train.shape, y train.shape)
30 #No longer needed as keras can split validation automatically
31 \#x train, x validation, y train, y validation = cross validation.train test split(x train, y train, test size=0.1, random state=121)
33 print("data ready")
34 #Model definition
36 model = keras.models.Sequential()
37 model.add( layers.Conv2D(filters=32, kernel_size= 5, strides=1,padding='same', activation='relu', input_shape= x_train.shape[1:] ))
38 model.add( layers.MaxPooling2D(pool_size=4, strides=2 ) )
39 model.add( layers.Flatten() )
40 model.add( layers.Dense(N HIDDEN, activation='relu'))
41 model.add( layers.Dense(y train.shape[-1], activation='softmax'))
42 sgd= keras.optimizers.SGD(lr=LEARNING_RATE, decay=0., momentum=0., nesterov=False)
44 #Advanced topic: use tensorflow directly inside keras we won't discuss now
45 def roc auc(y true, y pred):
46 auc = tf.metrics.auc(y_true, y_pred)[1]
    keras.backend.get session().run(tf.local variables initializer())
48
    return auc
50 model.compile(loss='categorical crossentropy',optimizer=sqd, metrics=['accuracy', roc auc])
51 print("network created")
52 print("training begin")
53 model.fit(x train, y train,epochs=N EPOCHS, batch size=BATCH SIZE, validation split=0.1)
54 score = tuple(model.evaluate(x test, y test, batch size=BATCH SIZE))
55 print("Testing evaluation loss %f acc %f roc_auc %f"%score)
```

My solution: ./1 tf intro/examples/e5 nNet keras.py

To be continued
